## 2 way switch module

### how it works

A 2 way switch module (2WSM) takes the incoming unswitched power and feeds the connected luminaires with switched power. A 2WSM is switched on and off via wall mounted switches mounted for example at opposite ends of a corridor or room.

### scenario

This scenario shows a 2WSM being used to power all the luminaires in the room via extender cables and fixed 't' pieces attached to the luminaires. The 2WSM switches the incoming power utilising the wall switches mounted near each doorway – 2 way switch drop lead is provided for connection between the 2WSM and the wall switches.
